

Picture Depth

Z-axis = represents the imaginary line that extends from the camera.

Depth of Field- is where objects are in focus along the z-axis.

Z-axis blocking = placing subjects along the Z axis.

Lens choice

Lens choice refers to the zoom position your camera is in.

Zoom out= Wide angle lens =
Z-axis expansion

Zoom In=Narrow angle lens=
Z-axis compression/squishing

Wide Angle lens = allows for great depth of field/deep focus and is easier to capture movement

Narrow angle lens = can use shallow depth of field to isolate subject and is hard to capture movement.
